

AE Call-Prep Agent

The valuable part of call prep isn't collecting information — it's synthesising it. Today that synthesis lives inconsistently in each AE's head. This puts the synthesis in the tool instead.

Built

- Multi-turn chat, Claude native tool use — no framework
- Live Snowflake (CRM · product · support, 7 tools) + Drive (7 enablement docs)
- Every answer shows its sources; 👍/👎 feedback logged
- Automated eval suite — caught a real prompt bug before the demo did
- Conversation history — multiple accounts, switch between them

Cut, deliberately

- Enterprise AE flow — a different problem, per Ines's interview
- In-call support — brief defines pre-call Q&A, not live-call
- Persistent memory / Salesforce write-back — v2 ideas
- Vector DB — unnecessary at this scale
- Text-to-SQL — too much surface area to trust

Architecture

- A while loop around Claude tool-use — the whole runtime
- 7 fixed, parameterised Snowflake tools — no text-to-SQL
- TF-IDF-weighted keyword search — no embeddings
- Connection reuse: first call ~3.6s, then ~300ms
- Auth: Programmatic Access Token
